## **VACUUM BREAKER & PRESSURE BREAKER**

A pressure vacuum breaker (PVB) serves as backflow protection device that prevents contaminated water from entering a clean water supply. Backflow protection valves are commonly used in irrigation systems where non-potable or contaminated water circuits are fed directly from fresh water supplies. This prevents the water already in the irrigation system from flowing back into the fresh water system. To achieve this backflow protection, pressure vacuum breakers are fitted with a spring loaded valve held open by the pressure from the fresh water supply. Should the supply be interrupted, the pressure vacuum breaker closes and prevents contaminated water from flowing back into the drinking water circuit.
